abstract in analysis of the contingency tables the fisher s exact test is a very important statistical significant test that is commonly used to test independence between the two variables however the fisher s exact test is based upon the assumption of the fixed margins that is the fisher s exact test uses information beyond the table so that it is conservative to solve this problem we allow the margins to be random this means that instead of fitting the count data to the hypergeometric distribution as in the fisher s exact test we model the margins and one cell using multinomial distribution and then we use the likelihood ratio to test the hypothesis of independence furthermore using bayesian inference we consider the bayes factor as another test statistic in order to judge the test performance we compare the power of the likelihood ratio test the bayes factor test and the fisher s exact test in addition we use our methodology to analyse data gathered from the worcester heart attack study to assess gender difference in the therapeutic management of patients with acute myocardial infarction ami by selected demographic and clinical characteristics

new statistics are proposed for testing the hypothesis that two non continuous random variables are independent these statistics which lead to consistent tests are cram ⸮ r von mises and kolmogorov smirnov type functionals of the checkerboard copula the power of the new tests is compared via simulation to those based on the pearson chi squared likelihood ratio and zelterman statistics often used in this context to study their power data are generated from five families of bivariate distributions whose margins may be known or not in all cases considered the new tests are seen to be more powerful than the standard tests the new tests and the zelterman statistic maintain their levels when the data are sparse as is well known this is not the case for pearson s chi squared and the likelihood ratio test on the basis of the results presented here the new cram ⸮ r von mises statistics can be recommended to test the independence between two random variables in the presence of ties in the sample
